

Wi-Fi for Exhibitors

Many exhibitors rely on internet during the event. They want to present their products and services.

Perhaps they showcase their websites, use on-line questionnaires for lead retrieval, or allow people to order via web shops.

Many exhibitors decide to set-up their own Wi-Fi devices and create private networks.

Although this might seem like a good solution, during the event they may run unstable and can cause serious interference.

These networks are not configured correctly, and do not take into account the networks from the organization, the venue or even other exhibitors.

This will create disruption in the workings of these networks and decrease the workings of the Wi-Fi for all users.

During the event a free wireless network is made available for all attendees. This network will provide standard functionalities for your usage.

For any crucial activities on the stand, we will always advise exhibitors to use a wired connection.

If Wi-Fi is absolutely necessary, the Amsterdam RAI can offer several Wi-Fi alternatives for Exhibitors.

These networks will be within our control and influence and while separated from the other networks, will be able to co-exist without interference.

A good communication and setting of guidelines is of the utmost importance to keep the air clean for all users. For this we will make strict agreements with the organizer.

If you are looking for a solution please inform your RAI sales representative and ask for the available options.
